

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The network protocol analyzer logs (tcpdump) indicate that UDP port 53 is unreachable when attempting to access www.yummyrecipesforme.com. Port 53 is normally used for DNS traffic. The ICMP error message was returned three times at 13:24, 13:26, and 13:28. This likely indicates a problem with the DNS server.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

The incident occurred at 1:24 p.m. Several customers reported that they could not access the company website www.yummyrecipesforme.com and the page would not load. The IT security analyst used tcpdump to capture and analyze the network traffic while attempting to visit the website. The resulting logs revealed that the DNS server (203.0.113.2) responded three times with an ICMP error message stating that UDP port 53 is unreachable. The requests were sent at 13:24, 13:26, and 13:28. The DNS server is likely not functioning properly, possibly due to a misconfiguration or a denial-of-service (DoS) attack targeting port 53.
